TERMINOLOGY DEFINITION

■ **Shrink Wrapper:**

A Packaging device used in the industry to encase products in plastic film, providing protection and enhancing presentation.

■ **Trap Key:**

A safety mechanism using keys in a predetermined sequence that prevents unauthorized access to a machine while maintenance is being performed thus preventing shortcuts and enhancing operator safety.

■ **Engineering Control:**

Physical modifications to the workplace that reduce hazards (e.g., safety devices, interlocks, machine guards).

■ **Administrative Control:**

Policies or procedures aimed at reducing risks (e.g., training sessions, safety protocols, LOTO procedures).

■ **OSHA:**

Occupational Safety and Health Administration is a U.S. agency that ensures safe and healthy working conditions by setting and enforcing standards.

■ **RPM:**

Revolution Per Minute

■ **Man-Machine Interface:**

The interface that ensures effective communication, control, and feedback between humans and machines to prevent accidents, reduce errors, and enhance operational safety.

BRIEF OVERVIEW

Safety in beverage plants is paramount, especially where heavy machinery and human interaction pose significant risks. In a shrink wrapper area, a tragic accident occurred due to unsafe practices exposing a critical gap in safety protocols.

This report highlights the safety concerns related to the current machinery setup. In collaboration with **Fortress, BRIGS** has implemented the Trapped Key Interlock system that enforces strict safety protocols. This system ensures that machines cannot be operated unless all predefined safety measures are fully adhered to. Doing so prevents accidents and reduces downtime by allowing safe access for minor maintenance activities.

The Result

- Accidents Down
- Safety Compliance Up
- Operational Efficiency Boosted

The Impact

- Immediate and
- Enduring

This case study showcases the transformative power of engineering controls in creating safer, more productive industrial environments.

It's not just jargon but real change in action.

THE CONCERN

The existing safety measures in place for the shrink wrapper machines are inadequate, particularly concerning the switch employed in the system. This switch is not safety-rated, which poses a significant risk in a hazardous environment.

Hazards in Beverage Plant

Giant Machinery and Movement of Massive Equipment

Man - Machine Interface Issues

Extreme Conditions - Exposure to Heat and Fire

Toxic

Corrosive Materials

Fire

Noise and Vibrations

Explosives

Fall Hazard

Biological Hazard

Electrical Hazards

Isolation Hazards

Amongst all the hazards one major area of concern in a Beverage plant is the **Man-Machine Interface**. Despite LOTO procedures, safety violations often occur due to pressure or shortcuts, which led to fatal incidents at a beverage plant shrink wrapper area..

THE CONCERN

Safety Gaps

- **Bypassing Safety Guards:**

Removing or disabling safety features on the machine can expose operators to moving parts.

- **Ignoring Maintenance Protocols:**

Failing to perform regular maintenance can result in equipment malfunctions and an increased risk of accidents.

- **Speeding Up Production:**

Rushing the packaging process can lead to mistakes and accidents, such as misaligned products.

- **Improvised Repairs:**

Using makeshift solutions instead of proper repair methods can compromise equipment safety.

Mitigating Risk

To mitigate the immense mix of hazardous variables at a beverage plant it is necessary to have a combination of

Engineering and
Maintenance Practices

Safe Working
Procedures

Training and
Communication

Personal Protective
Equipment (PPE)

THE CHALLENGE

The client requires a solution to eliminate the machine's capability for external resets. This feature currently heightens the risk of accidental operation, which could result in safety hazards and operational disruptions. However, the challenge lay in ensuring that such operations could be performed safely, without any risk.

THE SOLUTION

Although LOTO saves lives, it remains on OSHA's top 10 list for the most cited violations. The main reason is that LOTO is an Administrative Control that can be bypassed.

In most cases of work accidents, fatigue, complacency, and work pressure are the biggest causes of deviation from protocols. Therefore, **engineering control** has proven to be the most reliable in addressing such scenarios.

That is why **BRIGS** proposed **The Trapped Key Interlock Solution of Fortress**. This engineering control ensures that the machine cannot start unless all safety conditions are met. In addition, the solution offered custom flexibility, addressing major and minor maintenance activities, where traditional LOTO methods either weren't feasible or often bypassed.

Safety Features

- **Certified and Robust:**

A certified CAT 4, PL e device capable of withstanding 10KN of force, offering maximum protection.

- **Vertically Engraved Non-Duplicable Key:**

Ensures tamper-proof control with a unique combination, with the probability of duplication as low as one in 2 million.

- **Rugged Key:**

Designed for harsh industrial environments, the key is tested to perform reliably over 1 million cycles before deployment.

- **Safety-Rated Key Switch:**

Features NC-NO connections, eliminating the risk of arcing or welding, which prevents false feedback – a significant advantage over standard switches.

- **Patented Door Lock Module:**

Incorporates a forced key extraction system with a mechanical actuator, ensuring the key is always removed after use and not left in the door, enhancing operational safety.

WHY TRAPPED KEY SOLUTION?

Engineering Control vs Administrative Control

Unlike LOTO, which is often bypassed or not enforced rigorously, the Trapped Key Interlock provides a fail-safe engineering solution. It eliminates the risks posed by human error, shortcuts, and unexpected machine startups.

By implementing this solution, even if there is an unauthorized entry, the machine cannot be restarted, ensuring the operator's safety.

Trapped Key Interlock is a proven reliable Engineering Control

CLIENT SUCCESS

- **Zero Harm Machine Operations:**

Incorporates a forced key extraction system with a mechanical actuator, ensuring the key is always removed after use and not left in the door, enhancing operational safety.

- **Accident Reduction:**

Accidents caused by shortcuts and unexpected machine startups were eliminated, improving safety and operator confidence.

- **Operational Continuity:**

Despite stringent safety measures, the solution allowed safe, controlled access for both minor and major maintenance activities without compromising productivity.

- **Enhanced Safety Culture:**

The device enriches a safety culture, encouraging safe practices and reinforcing protocols for a secure workplace.

Scalable Safety Solutions

Enhanced Safety Culture

KEY TAKEAWAYS

- **Fail-Safe Engineering Control:**

The Trapped Key Solution provides 100% reliable, fail-safe protection without disrupting productivity.

- **Standards Compliance:**

The solution meets stringent CAT 4, PL e, Level E safety standards, ensuring compliance across high-risk operations.

- **Collaboration between BRIGS and Fortress:**

The combined expertise brought to this solution underscores its industry- leading effectiveness.

CONCLUSION

By integrating the **Trapped Key Interlock** system, **BRIGS** has fundamentally transformed the safety culture within the shrink wrapper areas, reducing both accidents and downtime. This engineered solution represents a critical shift from administrative controls to a robust, tamper-proof engineering control that ensures total compliance with safety standards.

The implementation has not only enhanced safety but has also improved productivity, setting a new standard for safe industrial operations.

This collaboration between BRIGS and Fortress underscores the powerful impact of engineering controls in fostering safer, more efficient industrial environments.

ABOUT US

At **BRIGS**, we design innovative and sustainable safety solutions that protect both people and machines without compromising productivity. Our expertise lies in creating safer, more efficient, and fully compliant workplaces through advanced platforms like Factory U/X, Factory O/S, and M/P Safety.

With a mission to build secure and self-regulating work environments worldwide, our B11 Licensed Machinery Safety Specialist and Workplace Safety Experts, with a 360-degree overview of machine safety, offer comprehensive services across the entire machine life cycle. From risk assessments to compliance with international standards like ANSI B11.0:2010 and ISO 12100, we ensure that your workplace is safeguarded from operational hazards.

In partnership with Fortress, we have successfully collaborated to deliver cutting-edge solutions like the Trap Key Interlock System, enhancing workplace safety and setting new industry standards. Together, we are committed to making safety seamless and workplaces productive.
